

## Question 2

### Pseudocode

current-floor  $\leftarrow$  0

OUTPUT "Enter requested floor: "

INPUT requested-floor

IF requested-floor = current-floor:

OUTPUT "Doors opening"

ELSE IF requested-floor < current-floor:

OUTPUT "Moving Down"

current-floor  $\leftarrow$  requested-floor

ELSE:

OUTPUT "Moving Up"

current-floor  $\leftarrow$  requested-floor

ENDIF

### PAC

Given Data

current-floor

requested-floor

Required results

Updated current-floor

Processing required

IF requested-floor = current-floor

OUTPUT "Doors opening" Floor

...

ENDIF

Alternative solutions

define outputs as constants

# IPO

| Input                            | Processing                                                          | Module reference | Output                                     |
|----------------------------------|---------------------------------------------------------------------|------------------|--------------------------------------------|
| current floor<br>requested floor | - Floor requests<br>• Doors opening<br>• Moving up<br>• Moving down | Calculate        | - <del>At</del> Current floor notification |

## Flowchart
